WE IMPROVE WHAT MATTERS.

Our customers inspire us.

They take on the great upheavals and challenges of our time. They actively work on future-oriented and sustainable technologies.

Whether in outer space or upon the stormy sea, under high pressure or at high speed: The components of our customers must stand up to the most extreme situations. We feel right at home wherever optimum properties are essential and every micrometre and microgram counts. As a companion and trailblazer for our customers. We develop and perfect state-of-the-art heat treatment and coating processes that lend the crucial additional durability and resistance to precision components.

For us the highest quality standards also mean the highest environmental standards.

It is our firm belief that sustainability and economic success can go hand in hand. The environmentally friendly and resource-saving production processes we employ make us pioneers in our industry. A path that we follow out of conviction – for our customer, for our planet and for future generations.

WE IMPROVE WHAT MATTERS.

"PERFECTED SURFACE TECHNOLOGY FOR PRECISION COMPONENTS."

DEPENDABLE WHEN THE NEAREST WORKSHOP IS 20,000 KM AWAY.

PERFECTED HEAT TREATMENT AND COATING.

Making the state of the art our standard – this claim makes us one of the leading providers of heat treatment processes and coating solutions in Europe.

For our processes, we rely on cutting-edge technologies such as plasma nitriding, vacuum hardening, low pressure carburising and inductive hardening. We attach primary importance to reproducible quality. We know: Every component that leaves our furnaces must hold up in critical situations.

This is why we tailor each process individually to the needs of our customers. Our team of experts advises you on the treatment process from start to finish. Together we choose the process that fits your requirements best.

Our processes at a glance:

\rightarrow Nitriding

Oxidising, gas nitriding, salt bath nitriding, nitrocarburising, nitrocarburising with post-oxidation (NIOX and ALDOX), plasma nitriding

ightarrow Hardening & tempering

Bainitising, quenching and tempering, tempering, salt bath hardening, bright hardening, vacuum hardening

ightarrow Edge layer hardening

Inductive hardening, carbonitriding, edge layer hardening, case hardening, low pressure carburising (LPC), Laser hardening

ightarrow Annealing

Soft annealing, stress-free annealing, precipitation hardening, normal annealing, solution annealing, intermediate annealing

ightarrow Coating

PVD coating, DLC coating, phosphating, anodising, chemical nickel plating, burnishing, galvanic zinc plating

Additional services

Straightening of steel, deep cryogenic treatment, magnetic powder crack testing, blast cleaning, material analysis, hardness testing, metallography

Ν

<u>NITRIDING</u>

Nitriding is one of our core competencies. As a thermochemical process, the purpose of nitriding is to specifically improve the surface hardness of steel – a crucial property for minimising wear and extending the service life of components.

Our teams of experts use various nitriding processes, all of which are distinguished by their minimum warping. Components can therefore be almost completely processed before the hardening process. This ensures high heat resistance of up to 600 °C. Nitriding offers wide application possibilities: While almost any steel can be nitrided, alloy steels are particularly suitable. Our teams of experts are always at your side to support you.

Advantages:

- ightarrow Improved surface hardness
- ightarrow Reduced wear
- ightarrow High corrosion resistance combined with a low friction coefficient
- ightarrow Heat-resistant up to 600 °C
- ightarrow Partial hardening possible

Hardening and tempering are processes that we have perfected at HÄRTHA.

They can optimise the mechanical properties of steel. By hardening we increase the hardness and tensile strength of the steel through controlled heating and rapid cooling. However, this also leads to increased material brittleness, and so the process is followed by tempering. Controlled heating and slow cooling during tempering reduce brittleness, while achieving an excellent balance between hardness, toughness and strength.

Because we understand the importance of this delicate balance, at HÄRTHA we adapt each procedure individually to ensure the optimum properties for your specific requirements.

Advantages:

- ightarrow Improved hardness, tensile strength and wear resistance
- ightarrow Increased toughness through tempering
- ightarrow Processes customised to individual needs
- ightarrow Perfectly reproducible results

1,020° C

HARDENING AND TEMPERING

T

Through targeted austenitising of the edge layer, i.e. a transformation of the microstructure by heating and quenching, we increase the hardness of the surface, while preserving the toughness of the component's core. Ideal for applications calling for high wear resistance and durability, this process can be applied to a wide variety of steel types.

Case hardening or carbonitriding requires that austenitising is preceded by a carbonising step using carbon or carbon and nitrogen. Tempering after edge layer hardening allows the component to be optimised for its particular use.

Our team of experts guarantees a fast and high-quality implementation of your order, using state-of-the-art systems.

Advantages:

- ightarrow Increased durability and fatigue strength
- ightarrow Improved vibration resistance of the component surface
- \rightarrow Enhanced rigidity and resilience of the working surfaces
- ightarrow Greater precision and improved surface quality
- ightarrow Suitable for a large number of steels and applications

<u>EDGE LAYER</u> <u>HARDENING</u>

Edge layer hardening, also known as surface hardening, is a process that we at HÄRTHA use with great care and precision, in order to increase the quality and durability of your components.

<u>ANNEALING</u>

1,300° C

A heat treatment process that reduces the degree of hardness in metals, while increasing their flexibility and reducing their internal stresses, annealing constitutes a key technique in our range of services at HÄRTHA.

By subjecting the component to heating up, heating through and cooling, we change its material properties in order to perfectly prepare the microstructure, e.g. for cold forming. Whether individual parts or entire series, our modern systems at different locations enable us to complete even short-term orders on time. Our many years of experience are your guarantee for maximum quality in every annealing process.

850° (

Advantages:

- ightarrow Increased durability and reliability
- ightarrow Optimisation of the microstructure
- ightarrow Improved component integrity
- → Ideal preparation for cutting and non-cutting machining
- Restoration of the initial state for additional treatments or machining processes

550° C

<u>COATING</u>

The coating of components, especially by means of the PVD process, is one of our specialities at HÄRTHA. PVD, short for Physical Vapour Deposition, is a process in which the coating material is evaporated and then applied to the workpiece.

This process serves to protect the surface and improve its decorative and functional properties. Our PVD coatings are distinguished by their brilliant colour quality.

Our well-founded know-how and state-of-the-art technologies allow us to guarantee you the highest quality and timely execution of your orders. Whether you need PVD or PaCVD coatings, you can trust us as your reliable partner.

Advantages:

- ightarrow Great dimensional stability
- ightarrow Improved wear resistance and hardness
- ightarrow Lower friction thanks to smooth surfaces
- ightarrow Versatile layer structure (mono-layer, multi-layer)
- ightarrow Visual refinement of the components

ADDITIONAL SERVICES

Härtha offers a variety of valuable additional services that fit perfectly into your production process.

From straightening, to deep cryogenic treatment, to magnetic powder testing - we provide solutions tailored to your specific requirements. We use blast cleaning to ensure clean surfaces, while our material analyses and hardness tests provide valuable information about the properties of your material. In addition, our metallography allows for an accurate examination of the microstructure of your materials. Trust in our extensive services, and benefit from efficient and quality-oriented production.

More details about our additional services are also available here:

Our additional services at a glance:

- ightarrow Rectification of steel
- ightarrow Deep cryogenic treatment
- ightarrow Magnetic powder crack test
- \rightarrow Blast cleaning
- ightarrow Material analysis
- ightarrow Hardness test
- ightarrow Metallography

WE CANNOT EASE YOUR DEADLINE PRESSURE. BUT WE CAN BOOST THE LOAD CAPACITY OF YOUR CRANE.

HOLISTIC APPROACH TO QUALITY MANAGEMENT

Quality is not a random product, but the result of a clear-cut attitude. Thinking in quality terms is an integral part of our corporate culture.

To us, this translates to regarding every single team member as an indispensable part of quality assurance. Everyone at HÄRTHA constantly strives to achieve the best outcome throughout the entire process.

We are convinced that consistently superior quality is impossible without the interaction of different types of expertise as well as individual commitment. This attitude pays off: We regularly pass the toughest customer audits and meet the strictest international standards for quality, energy and environmental management.

In our state-of-the-art laboratories we apply all current testing methods. These testing methods are largely non-destructive. Not only is our forward-looking commitment to quality, the environment, energy, and process reliability commendable – it has also been confirmed with certificates and seals of approval.

"TO US, QUALITY IS AN ATTITUDE. AN ATTITUDE DEEPLY INGRAINED IN EVERYONE AT HÄRTHA."

SERVICE ON LEVEL TERMS.

INEN

ZU HA NDEREN ZU W

We interpret service as a promise that we give to our customers. A promise that you as a customer are not just looked after, but also understood.

To this end, we are happy to walk in the customer's shoes and we try to recognise your individua requirements and wishes, to fulfil them in the best way possible.

We support you with your project from start to finish. We understand that our customers are often under time pressure, and so we offer you flexibility and reliability and, if necessary, undertake the safe transport of your components from us to your location. Equally important to us is the training and further education of our customers. We offer training and further education to promote a deeper understanding of our processes and procedures. We are happy to share our comprehensive process knowledge along with our long years of experience.

Because our goal is to build a lasting and trusting working relationship, rather than meeting your expectations just once.

SO THAT SUSTAINABILITY CAN REMAIN FRONT AND CENTRE - TODAY AND TOMORROW.

Aldenhoven location

SUSTAINABILITY – COMMMITTED TO FUTURE GENERATIONS.

For us sustainability is not just a buzzword – it is the core of our business. By increasing the durability and efficiency of components, our refinements save valuable resources.

We lead by setting a good example. We are firmly convinced that: Decisions are never based solely on financial considerations. This is why all our considerations always include ecological and societal aspects as well.

We have now switched to renewable energies for our electricity consumption. Our own photovoltaic installations make a major contribution to this effort. We invest in state-of-the-art and highly energyefficient plant technology, and implement digital measurement concepts to further optimise our use of resources. We are proud to be part of the global Science Based Targets Initiative (SBTI) and actively advocate for CO2-neutral corporate management.

We follow this path with great conviction. We promise future generations to walk this path with unwavering determination.

"WE MAKE SUSTAINABILITY POSSIBLE."

THIS IS WHERE WE PERFECT YOUR PRODUCT. VISIT US.
